The present invention relates to a high efficiency codec, a switch-equipped codec and a codec system, capable of high efficiency coding and decoding a digitally encoded audio signal. High efficiency codecs are required to allow efficient coding and decoding of the digitally encoded audio signal. The most important high efficiency codecs include an ADPCM codec, an LDPC codec and a transform codec (such as ITU-G.718 codec). The ADPCM codec, first developed by the Intel Corporation, and currently adopted as ITU-T Rec. G.722 (AL2) requires less encoding processing. The LDPC codec is a codec which combines turbo coding and LDPC coding, and is quite

robust against a channel error, having a high coding efficiency. The transform codec has a high encoding efficiency, but requires a large amount of encoding processing. A maximum number of bits in a channel-encoded block in such a conventional codec was limited by the number of bits in the channel-encoded block. More specifically, if an encoding target signal is a multi-channel signal, the conventional codec encoded the multi-channel signal by dividing the multi-channel signal into a plurality of channel-encoded blocks corresponding to respective channel signals, and encoding the respective channel-encoded blocks. Therefore, the conventional codec could not control a number of bits in the channel-encoded block corresponding to each channel. Hence, in the conventional codec, encoding efficiency could not be improved unless a complexity of the encoding processing was increased. found to be active during respiration, whereas the *\*gdh-2\** transcript
